

VantaPlayer - Repository Summary

Evidence source: repository code/docs only. Missing items are marked as Not found in repo.

What it is

VantaPlayer is a macOS SwiftUI desktop audio player for local files. It imports audio files/folders, manages a playback queue, and runs playback through AVAudioEngine.

Who it's for

- Primary user/persona (explicit statement): Not found in repo.
- Inferred from code: a macOS user managing and playing local audio files with keyboard and menu controls.

What it does

- Imports audio through Open File, Import Folder, and drag-and-drop; accepts wav/mp3/m4a/aiff/flac.
- Builds a selectable/reorderable queue, supports remove actions, and flags unplayable tracks.
- Provides playback controls: play/pause, previous/next, seek, scrubbing slider, and volume control.
- Extracts metadata/duration/artwork from AVURLAsset and shows title, artist, album, and track status.
- Saves and restores session state: queue, selected/playing track, playback positions, and volume.
- Integrates keyboard shortcuts, menu commands, MPRemoteCommandCenter, and Now Playing info updates.
- Supports compact/normal modes, playlist and inspector toggles, and density presets in UI settings.

How it works (repo-evidenced architecture)

- UI layer: VantaPlayerApp -> PlayerView -> PlayerViewModel (SwiftUI state + command handling).
- Playback service: AudioEnginePlayer wraps AVAudioEngine, AVAudioPlayerNode, and AVAudioMixerNode.
- Import pipeline: TrackImportWorker scans files/folders, filters extensions, loads metadata, creates Track models.
- Persistence services: SessionStore serializes session snapshots to UserDefaults; BookmarksStore manages security-scoped bookmarks.
- Data flow: user action -> PlayerViewModel updates tracks/selection -> AudioEnginePlayer publishes time/state -> UI refresh + debounced session save.
- Visualizer pipeline exists in repo (AudioAnalyzer -> SpectrumStore -> VisualizerView/RibbonRenderer), with a comment noting it is inactive in current PlayerViewModel wiring.

How to run (minimal)

- Open /Users/dmitry/Projects/VantaPlayer/VantaPlayer/VantaPlayer.xcodeproj in Xcode.
- Select the VantaPlayer scheme/target and a macOS run destination, then Run (Cmd+R).
- After launch, import audio via Open Audio Files (Cmd+O) or Import Folder (Cmd+Shift+O).
- Standalone CLI/devcontainer setup instructions: Not found in repo.
